Cloud Operations Demo

REX_SYNTHETIC_DEMO | Fictional TA example. No real academy offering, instructor, accreditation or tender.

Course ID: DEMO-CL-301

Title: Cloud Operations Demo

Description: A fictional advanced course in secure cloud operations, service monitoring, incident response and recovery planning. Exercises run locally or use documented examples; no real deployment or paid cloud account is required.

Level: Advanced

Training format: On-site

Price EGP: 7200 EGP

Duration hours: 40

Department: Cloud and Infrastructure

Instructor name: Omar Demo Instructor

Instructor bio: Fictional infrastructure instructor; no real certifications claimed.

Schedule: Demo cohort: 10 sessions of 4 hours on Saturdays; venue and dates require confirmation.

Offers: No active promotion is specified.

Target audience: Developers and administrators with Linux and networking experience.

Career opportunities: Cloud operations practice; Site reliability foundations

Admission requirements: Laptop supporting containers; A local container runtime

Prerequisites: Linux command line; HTTP, DNS and basic networking; Basic containers

Learning outcomes: Define least privilege access; Design service health checks and alerts; Test backup restoration and incident steps

FAQs: [{"question": "Is a paid cloud account required?", "answer": "No. The demonstration uses local containers and authored architecture examples."}]

Course content

This material is an authored fixture for testing ingestion and document workflows. It is not an accredited curriculum.

Access and boundaries

Map service identities to required operations. Remove wildcard permissions and explain least privilege. Exercise: draft a read-only access policy without embedding any secret.

Monitoring

Define availability and latency measures. Use a local health endpoint and simulate a failed dependency. Explain the difference between liveness and readiness.

Incident handling

Document detection, triage, mitigation and follow-up. Exercise: investigate an intentionally stopped local container using logs and a timeline, without deleting persistent volumes.

Recovery project

Back up a fictional configuration directory and restore it to a new location. Record recovery time and verify checksums. Assess safety 40 percent, observability 30 percent and recovery evidence 30 percent.
